THEMATIC AREA OVERVIEW

Technology built for real-world impact

SEPAFRICA Software Development is one of SEPAfrica's four thematic areas, alongside Digital Health and Education & Scholarships. It brings together software engineering and artificial intelligence work under one practice — the same engineering team that builds SEPAfrica's own platforms, including SEP-Scholarship and the DOPV digital health platform, also takes on external software, AI, and automation projects.

Our work sits at the intersection of technology and social entrepreneurship: we design and develop digital platforms, applications, and technology solutions that address real-world challenges and improve access to services, and we support the development of artificial intelligence through data preparation, annotation, evaluation, and the training of Large Language Models — with a focus on building useful and responsible AI.

Software Engineering

Digital platforms, applications, and technology solutions designed and built to address real-world challenges.

AI & LLM Data Training

Data preparation, annotation, evaluation, and LLM training — focused on useful, responsible AI.

Automation Services

AI-assisted workflow automation for businesses — every draft reviewed and approved by a human before it goes out.

PART OF A WIDER MISSION

SEPAfrica is a social impact and technology initiative advancing Africa's progress toward the Sustainable Development Goals. Software Development is how we build the tools — for ourselves and for other organisations — that make that mission possible.

WHAT WE BUILD

Software Engineering

We design and develop digital platforms, applications, and technology solutions that address real-world challenges and improve access to services. Our own platforms — SEP-Scholarship and the DOPV digital health platform — are built and run by this same team, so the work we take on for other organisations is grounded in what we've already shipped and maintained ourselves.

Web & mobile platforms

Full-stack web applications and mobile-friendly platforms, from first design through to production.

Systems integration

Connecting the tools you already use — payments, CRMs, databases — into one coherent system.

Verification & workflow systems

Multi-party workflows with review and approval steps, like the verification and award flow behind SEP-Scholarship.

Ongoing product support

We maintain and evolve what we build, rather than handing over a platform and disappearing.

BUILT AND PROVEN ON OUR OWN PLATFORMS

SEP-Scholarship — our verified scholarship-matching platform — and DOPV, our digital health platform, are both designed, built, and maintained by this team. When we take on outside engineering work, it's with the same standards we hold our own products to.

RESPONSIBLE AI, BUILT ON GOOD DATA

AI & LLM Data Training

We support the development of artificial intelligence through data preparation, annotation, evaluation, and the training of Large Language Models (LLMs), with a focus on building useful and responsible AI solutions. Good models start with good data — that's where our work is concentrated.

1**Data preparation**

Sourcing, cleaning, and structuring data so it's ready for annotation and training.

2**Annotation**

Human-reviewed labelling and tagging, built for accuracy on the specific task at hand.

3**Evaluation**

Testing model outputs against real criteria, catching issues before they reach production.

4**QC & delivery**

A quality-control summary is drafted for review before any labelled dataset ships to a client.

BUILDING RESPONSIBLE AI

Every dataset and evaluation we produce goes through a human quality-control review before it's delivered — the same draft-then-approve discipline we apply across all of SEPAfrica's automation work. We aim for AI that is not just capable, but useful and responsibly built.

FOR BUSINESSES ACROSS NIGERIA

AI Automation Services

We help businesses save time on repetitive drafting and reporting work, without giving up control. AI drafts the first version — a newsletter, a customer reply, an invoice, a report — and a named person on your team reviews, edits, and approves it before anything is sent, posted, or filed. Nothing goes out on its own.

1. AI DRAFTS

2. YOUR TEAM REVIEWS

3. YOU APPROVE & SEND

Content & communications

Newsletters and social media drafts from your recent activity.

Customer support drafts

First-pass replies to common questions, reviewed before sending.

Sales & outreach

Personalised outreach and follow-up emails, approved by your team.

Finance & reporting

Invoice, expense, and periodic report drafts for your finance lead.

HR & recruitment

Job postings and first-pass candidate screening summaries.

Data & QC summaries

Quality-control and operations summaries from your own data.

This is the same human-in-the-loop model we run internally at SEPAfrica for our own newsletter and outreach — we're not selling a concept we haven't used ourselves.

ENGAGEMENT MODEL

How we work together

Whether it's a full platform build, an AI/LLM data project, or an automation pilot, we start small, prove value, and expand — rather than a long build with nothing to show until the end.

1**Discovery**

We learn your workflow, systems, and where the biggest opportunity is.

2**Pilot**

We build or automate one area first, with your team reviewing every output.

3**Review & expand**

Once the pilot works, we scale to further areas or a fuller build.

4**Ongoing support**

We maintain and refine what we've built as your needs change.

PRICING

- Development projects — a fixed build fee from USD \$15,000 to \$450,000, sized to complexity
- Ongoing subscription — monthly fee covering hosting, maintenance, and support
- Multi-area bundles — discounted pricing when combining services

Exact pricing depends on scope and systems involved — we size a proposal after the discovery call.

LEADERSHIP

Meet the Founder

Dazi Victor

FOUNDER & CEO, SEP AFRICA

Designer of SEP Africa — founded 2019

Dazi Victor founded SEP Africa in 2019 to support academically capable but financially disadvantaged students in Nigeria's public tertiary institutions — the founding idea that has since grown into SEP-Scholarship's technology-enabled approach to educational philanthropy across the continent.

He holds an MSc in Conflict Management and Peace Studies from the University of Jos and an MPH from Imperial College London, and is currently a postgraduate research student in Family Medicine at the University of Edinburgh.

Before founding SEP Africa, Dazi worked with the World Health Organization and Primary Care International in Oxford, UK, and served as Campaign Office Manager for President Goodluck Jonathan's 2015 presidential campaign. He has also served on several public and institutional committees.

As Founder and CEO of SEP Africa, Dazi continues to drive the organisation's mission of bridging gaps through technology and social entrepreneurship across Africa.

EDUCATION & BACKGROUND

EDUCATION

- MSc, Conflict Management & Peace Studies — University of Jos

CURRENT STUDY

- Postgraduate Research Student, Family Medicine — University of Edinburgh

EXPERIENCE

- Primary Care International, Oxford, UK

EDUCATION

- MPH — Imperial College London

EXPERIENCE

- World Health Organization (WHO)

EXPERIENCE

- Campaign Office Manager, President Goodluck Jonathan 2015 Campaign

Let's build something

Software. AI. Automation that stays under your control.
